Submitted (16-MAR-2001) Sanger Centre, Hinxton, Cambridgeshire, CBIO 15A, UK. E-mail enquiries: hunquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk

On Feb 16, 2001 this sequence version replaced gi:12584715.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the corresponding to the overlapping clone, as we submit sequences with a mall overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (1.e., phrzed quality >= 30); an attempt was made to resolve all sequencing problems, such one plasmid subclone or more than one MI3 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the Geature table with their source databases: Em: EMBL: Sw:, SWISSPROT; Tr:, TREMBL: WP:, WORMPEP; Information on the WORMPEP http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 10, constructed by the Sanger centre Chromosome 10 http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 10, constructed by the Sanger Centre Chromosome 10 http://www.sanger.ac.uk/Projects/Chrin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      http://www.sanger.ac.uk/MBP/Chrio
RP11-735G18 is from the library RPCI-11.3 constructed by the group
of Pieter de Jong. For further details see

Chung, I.K., Lee, S.Y., Ito, T., Tanaka, H., Nam, H.G. and Takagl, M.
The 5' flanking sequences of two S alleles in Lycopersicon
peruvianum are highly heterologous but contain short blocks of
homologous sequences
plant Cell Physiol. 36 (8), 1621-1627 (1995)
                                                                                                                                                                                                                                                                       Genbank staff at the National Library of Medicine created this entry [NCBI gibbsq 176855] from the original journal article. This sequence comes from Fig. 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A/T-stretch binding protein; transcription factor; ATBP. Prorster,A., Daniel,R. and Muller,V.
The Na(+)-translocating ArPase of Acetobacterium woodii is a
FIFO-type enzyme as deduced from the primary structure of its beta,
gamma and epsilon subunits
